No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

The invention describes a nucleic acid sequence (I) encoding an obtertagia ostertagia, or part of the nucleic acid sequence that encodes an immunogenic fragment of the protein, where the nucleic acid sequence or its part has at least 85% homology with the nucleic acid sequence of the 0. ostertagi gene having any of the 7 fully defined sequences of 306-1761 base pairs, as given in the specification. The composition and methods are useful for diagnosing, preventing or treating

The composition and methods are useful for diagnosing, preventing or treating infections caused by O. ostertagi in animals. This is the amino acid sequence of a novel immunogenic Ostertagia ostertagi protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diagnosing, preventing or treating infections caused by Ostertagia ostertagi in animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 15; SEQ ID NO 8; 36pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ancylostoma secreted protein ASP-1 is secreted by canine hookworm larve as they change from the free-living stage to the parasitic stage. The amino acid sequence of the ASP-1 pro-form (AAW04321) was detd. from a CDNA clone (AAT38466) obtd. from an Ancylostoma caninum L3 larvae cDNA library. ASP-1 represents a family of proteins (see also AAW04322-23) that are highly immunogenic in experimental animals. Recombinant ASP proteins can be produced in a variety of hosts. They can be used in

                                                                                                                                                                                                                                                                                                                                                                                                                         recombinant or synthetic antigen or their fragments derived from hookwox and a carrier. (I) is useful for vaccinating or eliciting an immune response against hookworm in a mammal, reducing blood loss in a patient infected with hookworm, reducing hookworm, or decreasing to hookworm burden in a patient infected with hookworm, or decreasing L3 migration across skin of a mammal. The above method further involves chemically treating a hookworm-infected patient prior to the step of administering. (M1) is also useful for vaccinating patient against infectious diseases e.g. HIV, tuberculosis, malaria, measles, tetamus, diphtheria, pertussis or noling their main controls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hotez P,

                                                                                                                                                                                The invention relates to a composition (I) comprising a copy of recombinant or synthetic antigen or their fragments derived from hookworm and a carrier. (I) is useful for vaccinating or eliciting an immune response against hookworm in a mammal, reducing blood loss in a patient infected with hookworm, reducing hookworm size or quantitative egg count or hookworm burden in a patient infected with hookworm, or decreasing L3 migration across skin of a mammal. The above method further involves chemically treating a hookworm-infected patient prior to the step of administering. (MI) is also useful for vaccinating patient against infectious diseases e.g. HIV, tuberculosis, malaria, measles, tetanus, diphtheria, pertussis or pollo. This sequence corresponds to a protein of
                                                                                                                                                                                                                                                                                                                                                           Composition useful for vaccinating or eliciting immune response against hookworm in mammal, comprises copy of recombinant or synthetic antigen their fragments derived from hookworm, and carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ASHC/)

The invention relates to a composition (I) comprising a correcombinant or synthetic antigen or their fragments derive and a carrier. (I) is useful for vaccinating or eliciting

comprising a copy of fragments derived from

an immune from

hookworm

Disclosure; SEQ

ID NO 2;

227pp; English.

Composition useful for vaccinating or eliciting immune response against hookworm in mammal, comprises copy of recombinant or synthetic antigen their fragments derived from hookworm, and carrier.

The above method further involves chemically treating a hookworm—infected patient prior to the step of administering. (M1) is also useful for vaccinating patient against infectious diseases e.g. HIV, tuberculosis, malaria, measles, tetanus, diphtheria, pertussis or polio.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a composition (I) comprising a copy of recombinant or synthetic antigen or their fragments derived from hooks and a carrier (I) is useful for vaccinating or eliciting an immune response against hookworm in a mammal, reducing blood loss in a patier infected with hookworm, reducing hookworm size or quantitative egg cou or hookworm burden in a patient infected with hookworm, or decreasing migration across skin of a mammal. The above method further involves chemically treating a hookworm-infected patient prior to the step of administering. (M1) is also useful for vaccinating patient against infectious diseases e.g. HIV, tuberculosis, malaria, measles, tetanus, diphtheria, pertussis or polio. This sequence corresponds to a protein

Caenorhabditis elegans

```
The invention relates to a transgenic nematode, the cells of which contain a transgene comprising a regulatory element of a gene that cencodes a nematode secretory product or its homologue operably linked to care an anti-nematode agent for use in preventing or reducing nematode infestation of a plant (the agent may be used to treat the soil or seed); (2) a vector comprising: (a) a vap-1 or vap-2 polymucleotide encoding to vap-1 or vap-2 polymucleotide encoding to vap-1 or vap-2; (iii) has a sequence comprising the Caenorhabditis can polymucleotide encoding vap-1 or vap-2; (iii) has a sequence comprising the Caenorhabditis can polymucleotide encoding vap-1 or vap-2 promoter operably linked to a polymucleotide encoding a detectable marker; or (b) a regulatory element comprising a polymucleotide encoding a detectable marker; (3) expressing a first polymucleotide in a C. clegans amphid sheath cell; and (4) expressing a polymucleotide in a C. clegans amphid sheath cell; and (4) expressing a polymucleotide in a C. clegans amphid sheath cell; and (4) expressing a polymptide in a C. clegans amphid sheath cell; and (4) expressing a polymptide in a C. clegans amphid sheath cell; and (4) expressing a polymptide in a C. clegans amphid sheath cell; and (4) expressing a polymptide in a C. clegans amphid sheath cell; and (4) expressing a polymptide in a C. clegans amphid sheath cell; and (4) expressing a polymptide in a C. clegans amphid sheath cell; and (5) expressing a polymptide in a C. clegans amphid sheath cell; and (6) expressing a polymptide in a C. clegans amphid sheath cell; and (6) expressing a polymptide in a C. clegans amphid sheath cell; and (6) expressing a polymptide in a C. clegans amphid sheath cell; and (6) expressing a polymptide in a C. clegans expression and company of the company of

New transgenic nematode having a transgene that regulates the expression of a nematode secretory product, useful for screening anti-nematode agents for treating, preventing or reducing nematode infestation in plants or individuals.

Claim 73; Fig 1; 105pp; English.

The invention relates to a transgenic nematode, the cells of which contain a transgene comprising a regulatory element of a gene that cencodes a nematode secretory product or its homologue operably linked to a DNA sequence encoding a detectable marker. Also included are (1) cidentifying a compound that inhibits a nematode secretion pathway, for the as an anti-nematode agent for use in preventing or reducing nematode infestation of a plant (the agent may be used to treat the soil or seed); (2) a vector comprising: (a) a vap-1 or vap-2 polymucleotide encoding VAP (2) a vector comprising: (a) a vap-1 or vap-2 polymucleotide having at the least 10 consecutive residues of VAP-1/VAP-2 or at least 50 % identity to VAP-1 or VAP-2; (iii) has a sequence comprising the Caenorhabditis celegans vap-1 or vap-2 promoter operably linked to a polymucleotide encoding a detectable marker; or (b) a regulatory element comprising to the C. elegans wap family of genes operably linked to a polymucleotide cencoding a detectable marker; (3) expressing a first polymucleotide in a C. elegans amphid sheath cell; and (4) expressing a polymucleotide in a C. elegans amphid sheath cell; and (4) expressing a polymetectic in a C. celegans amphid sheath cell; and (4) expressing a polymetectic in a composition containing the agent is useful for preventing or reducing the matched agents. The anti-nematode agent or pharmaceutical composition of plants, or for treating or reducing the composition of plants, or for treating or reducing the composition of plants, or for treating or reducing the composition of plants, or for treating or reducing the composition of plants, or for treating or reducing the composition of plants, or for treating or reducing the composition of plants, or for treating or reducing the composition of plants, or for treating or reducing the composition of plants, or for treating or reducing the composition of plants, or for treating or reducing the composition of plants, or composition of plants, or composition of plants, or com

                                                                                                                                                                                                                                                                                                                                                                                                   recombinant or synthetic antigen or their fragments derived from hookw and a carrier. (I) is useful for vaccinating or eliciting an immune response against hookworm in a mammal, reducing blood loss in a patient infected with hookworm, reducing hookworm size or quantitative egg cour or hookworm burden in a patient infected with hookworm, reducing hookworm size or quantitative egg cour or hookworm burden in a patient infected with hookworm, or decreasing I migration across skin of a mammal. The above method further involves chemically treating a hookworm-infected patient prior to the step of administering. (MI) is also useful for vaccinating patient against infectious diseases e.g. HIV, tuberculosis, malaria, measles, tetanus, diphtheria, pertussis or polio. This sequence corresponds to a protein the invention.
                                                                                                                                                                                                                                                                                                                                                                    Sequence 424 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Composition useful for vaccinating or eliciting immune response against hookworm in mammal, comprises copy of recombinant or synthetic antigen their fragments derived from hookworm, and carrier.

(I) is useful for vaccinating or eliciting an immune response against hookworm in a mammal, reducing blood loss in a patient infected with hookworm, reducing hookworm size or quantitative egg count or hookworm burden in a patient infected with hookworm or or decreasing L3 migration across skin of a mammal. The above method further involves chemically treating a hookworm-infected patient prior to the step of administering. (M1) is also useful for vaccinating patient against infectious diseases e.g. HIV, tuberculosis, malaria, measles, tetanus, diphtheria, pertussis or polio. This sequence corresponds to a protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hotez P,

The invention relates to a composition (I) comprising a copy of recombinant or synthetic antigen or their fragments derived from hookworm and a carrier. (I) is useful for vaccinating or eliciting an immune response against hookworm in a mammal, reducing blood loss in a patient infected with hookworm, reducing hookworm size or quantitative egg count or hookworm burden in a patient infected with hookworm, or decreasing L3 migration across skin of a mammal. The above method further involves chemically treating a hookworm-infected patient prior to the step of administering. (MI) is also useful for vaccinating patient against infectious diseases e.g. HIV, tuberculosis, malaria, measles, tetanus, the invention

                                                                          PCR primers Al12/301 and Al12/302 were designed to be used to amplify the DNA encoding the 45 kD protein. In the reaction containing primer Al12/301 a unique band of approximately 650 bp was observed. The approximately 650 bp band was not seen when primer Al12/302 was used. The PCR cloned was grown and purified for use as a hybridisation probe to screen the pBTA879 cDNA library. pBTA879 is the sequence of one of these clones. There is no methionine initation codon present in this region of the sequence so this clone probably does not represent in this region of coding region. pBTA879 probably encodes a glycoprotein which is related to, but not identical to, the native glycoprotein isolated from H. contortus. In order to isolate a cDNA clone coding for the full length native 45 kD antigen, cDNA libraries were screened with the fragment isolated from pBTA879. AAQ28094 is the sequence of one of these clones, pBTA 963. Once again, this clone does not contain an initiation methionine. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Key

(I) is useful for vaccinating or eliciting an immune response against hookworm in a mammal, reducing blood loss in a patient infected with hookworm, reducing hookworm size or quantitative egg count or hookworm burden in a patient infected with hookworm, or decreasing L3 migration across skin of a mammal. The above method further involves chemically treating a hookworm-infected patient prior to the step of administering. (MI) is also useful for vaccinating patient against infectious diseases e.g. HIV, tuberculosis, malaria, measles, tetanus, the invariant patients or polio. This sequence corresponds to a protein of the invariant patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure;

(I) is useful for vaccinating or eliciting an immune response against hookworm in a mammal, reducing blood loss in a patient infected with hookworm, reducing hookworm size or quantitative egg count or hookworm burden in a patient infected with hookworm, or decreasing L3 migration across skin of a mammal. The above method further involves chemically treating a hookworm-infected patient prior to the step of administering. (M1) is also useful for vaccinating patient against infectious diseases e.g. HTV, tuberculosis, malaria, measles, tetanus, diphtheria, pertussis or polio. This sequence corresponds to a protein of

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                            131

| Sequence 2, Application US/08419414
| Patent No. 5753787
| GENERAL INFORMATION:
| APPLICANT: Hocke, Peter J.
| APPLICANT: Jones, Brian F.
| ITIE OF INVENTION: Hockworm Vaccine
| NUMBER OF SEQUENCES: 16
| CORRESSEE: Paters L. Pabst
| STREET: 2800 One Atlantic Center
| STREET: 2800 One Atlantic Center
| STREET: 1201 West Peachtree Street
| CITY: Atlanta
| STATE: Georgia
| COMPUTER: READABLE FORM:
| MEDIUM TYPE: Ploppy disk
| COMPUTER: IBM PC Compatible
| OPERATING SYSTEM: PC-DOS/MS-DOS
| COMPUTER: IBM PC Compatible
| OPERATION TYPE: PLOPS |
| OPERATION TO STATE | US/08/419,414
| FILING DATE: OPERATION:
| APPLICATION NUMBER: US/08/419,414
| FILING DATE: DATE:
| CLASSIFICATION NUMBER: US/08/419,414
| FILING DATE: APPLICATION NUMBER: YUll3
| TELECHONEY AGENT INFORMATION:
| APPLICATION NUMBER: US/08/419,414
| FILING DATE: Pabst, Patrea L.
| REGISTRATION NUMBER: US/08/419,414
| FILING DATE: 1100 NUMBER: US/08/419,414
| FILING DATE: PASSIFICATION NUMBER: YUll3
| TELECOMONUSCATION UNFORMATION:
| TELEPHONE: (404) 873-8795
| INFORMATION POR SEQ ID NO: 2:
| SEQUENCE: CHARACTERISTICS:
| ENOTH: 424 amino acids
| TYPE: TYPE: Protein
| DATE: SUBJECTION: NOW NUMBER: US/08/419,414
| TYPE: AND ACCULATION NUMBER: US/08/419,414
| PURCHATION POR SEQ ID NO: 2:
| SEQUENCE: OPERATION: HORSES: TOPOLOGY: Linear
| OPERATORS: ACCULATION NUMBER: US/08/419,414
| TELEFAX: (404) 873-8795
